

## TONE SAVER® WIRING DIAGRAM

If you experience tonal change when turning down the volume control on your guitar, the **Fender Tone Saver®** is a great solution. Unlike traditional treble bleed circuits that involve connecting tiny parts together with delicate soldering, the **Tone Saver** contains a special R/C network inside one convenient enclosure that will keep your guitar's tone remarkably consistent at any setting. Just solder the leads to the center and outside lugs of your guitar's volume control and you're done.

Available for **250k** and **500k** audio guitar volume controls.
